

Task 1

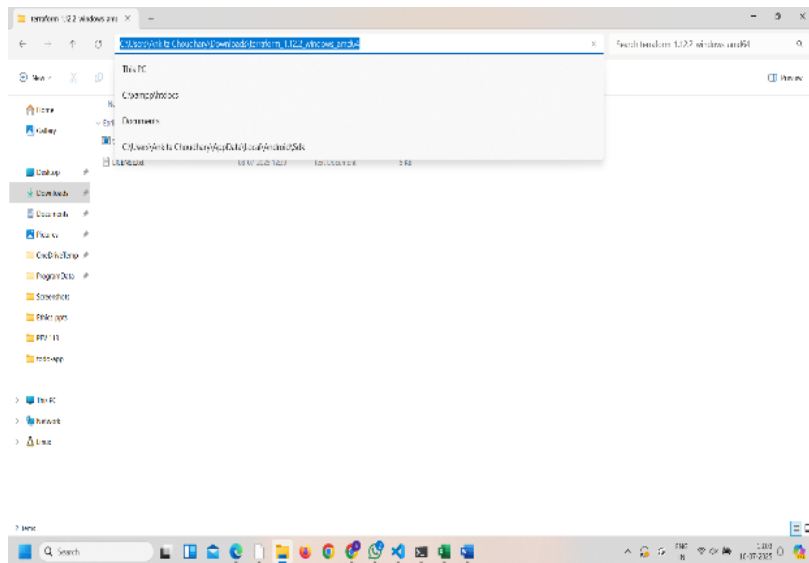

1. Download terraform(a zip file will be downloaded)

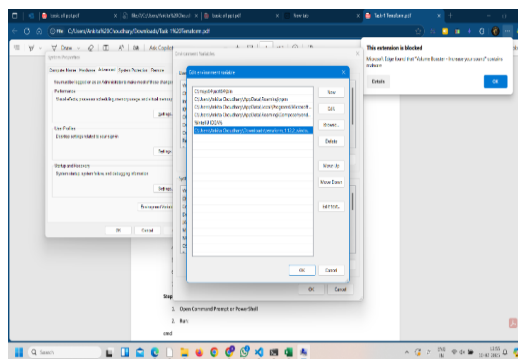

2.Extract the zip file

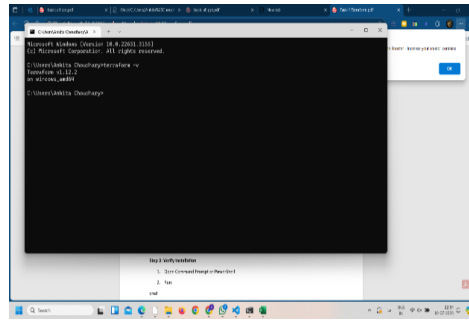

3. Open the zip file and cop the path

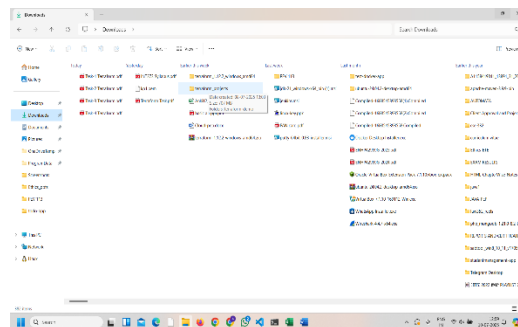

4. from tool bar search for environment variables and specify the path of terraform

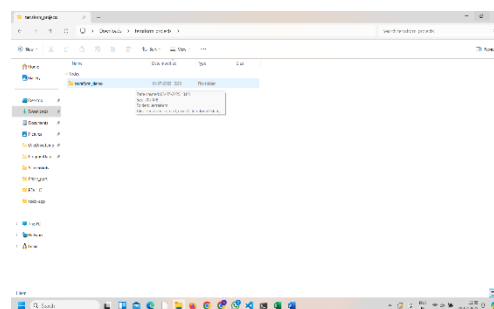

5. open cmd and check the command: terraform -v/--version

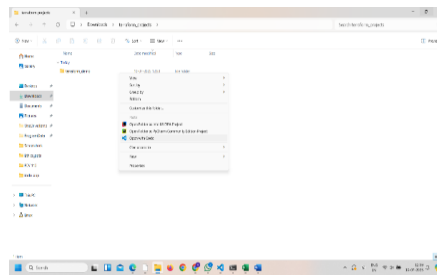

6. where terraform extracted zip file is located at
the same location create a
new file folder : terraform_projects

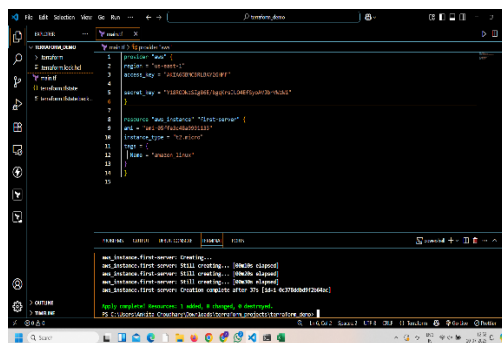

7.open that folder

8. create a new folder : terraform_demo and right
click and select open with code in vs code

9. in vs code write that code and use your own access key and secret key

10. open terminal and run the terraform commands(

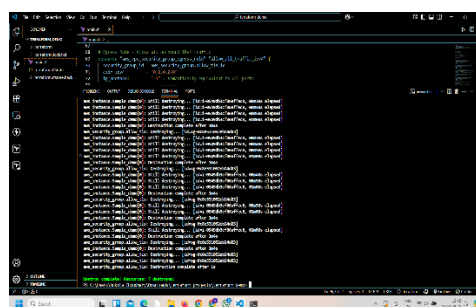

terraform init

terraform validate

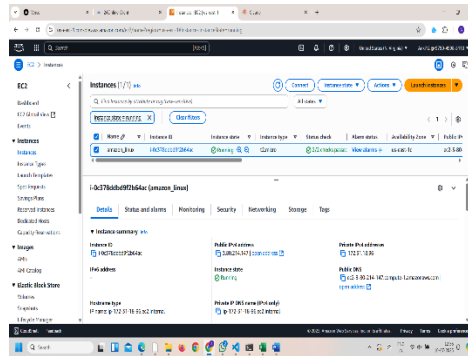

terraform plan

terraform apply(check if the instance was create or not in aws)

terraform destroy)

11. check if instance is created

12. now run terraform destroy command
